

MAX22245/MAX22246

Reinforced, Fast, Low-Power, Two-Channel Digital Isolators

General Description

The MAX22245/MAX22246 are a family of 2-channel reinforced, fast, low-power digital galvanic isolators using Maxim's proprietary process technology. These devices transfer digital signals between circuits with different power domains, using as little as 0.76mW per-channel at 1Mbps (1.8V supply). All of the devices in the family feature reinforced isolation for a withstand voltage rating of 5kV_{RMS} for 60 seconds.

The MAX22245 features two channels transferring data in the same direction. The two channels of the MAX22246 transfer data in opposite directions, and this makes the MAX22246 ideal for isolating the Tx and Rx lines of a transceiver.

Devices are available with a maximum data rate of 25Mbps or 200Mbps, and with outputs that are either default high or default low. The default is the state the output assumes when the input is either not powered or is open circuit. See the [Ordering Information](#) and [Product Selector Guide](#) for suffixes associated with each option. Independent 1.71V to 5.5V supplies on each side of the isolator also make the devices suitable for use as level translators.

The MAX22245/MAX22246 family is available in an 8-pin wide-body SOIC package with 8mm of creepage and clearance. The package material has a minimum comparative tracking index (CTI) of 400, which gives it a group II rating in creepage tables. All devices are rated for operation at ambient temperatures of -40°C to +125°C.

Applications

- Isolated RS232, RS485/RS-422, CAN
- General Isolation Applications
- Fieldbus Communications for Industrial Automation
- Medical Systems
- Motor Drive

Benefits and Features

- Reinforced Galvanic Isolation for Fast Digital Signals
 - Wide-Body 8-Pin SOIC with 8mm of Creepage and Clearance
 - Up to 200Mbps Maximum Data Rate
 - Withstands 5kV_{RMS} for 60s (V_{ISO})
 - Continuously Withstands 1500V_{RMS} (V_{IOWM})
 - Withstands $\pm 10\text{kV}$ Surge Between GNDA and GNDB with 1.2/50 μs Waveform
 - High CMTI (50kV/ μs , typ)
- Low Power Consumption
 - 0.76mW per Channel at 1Mbps with V_{DD} = 1.8V
 - 1.42mW per Channel at 1Mbps with V_{DD} = 3.3V
 - 3.2mW per Channel at 100Mbps with V_{DD} = 1.8V
- Options to Support a Broad Range of Applications
 - 2 Maximum Data Rates (200Mbps, 25Mbps)
 - 2 Channel Direction Configurations
 - 2 Output Default States (High or Low)

Safety Regulatory Approvals (Pending)

- UL According to UL1577
- cUL According to CSA Bulletin 5A
- VDE 0884-11 Reinforced Insulation

[Ordering Information](#) and [Product Selector Guide](#) appear at the end of the data sheet.

Functional Diagram

Absolute Maximum Ratings

V_{DDA} to GNDA.....	-0.3V to +6V
V_{DDB} to GNDB.....	-0.3V to +6V
IN_ on Side A to GNDA.....	-0.3V to +6V
IN_ on Side B to GNDB	-0.3V to +6V
OUT_ on Side A to GNDA	-0.3V to ($V_{DDA} + 0.3V$)
OUT_ on Side B to GNDB	-0.3V to ($V_{DDB} + 0.3V$)
Short-Circuit Continuous Current	
OUT_ on Side A to GNDA	±30mA

OUT_ on Side B to GNDB.....	±30mA
Continuous Power Dissipation ($T_A = +70^\circ C$)	
Wide SOIC (derate 11.35mW/°C above +70°C)....	908.1mW
Temperature Ratings	
Operating Temperature Range	-40°C to +125°C
Maximum Junction Temperature.....	+150°C
Storage Temperature Range	-60°C to +150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow).....	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

8 Wide SOIC

Package Code	W8MS+5
Outline Number	21-100415
Land Pattern Number	90-100146
THERMAL RESISTANCE, FOUR-LAYER BOARD	
Junction-to-Ambient (θ_{JA})	88.1°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	42.4°C/W

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to [www.maximintegrated.com/thermal-tutorial](#).

For the latest package outline information and land patterns (footprints), go to [www.maximintegrated.com/packages](#). Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Electrical Characteristics

($V_{DDA} - V_{GNDA} = 1.71V$ to $5.5V$, $V_{DDB} - V_{GNDB} = 1.71V$ to $5.5V$, $C_L = 15pF$, $T_A = -40^\circ C$ to $+125^\circ C$, unless otherwise noted. Typical values are at $V_{DDA} - V_{GNDA} = 3.3V$, $V_{DDB} - V_{GNDB} = 3.3V$, $V_{GNDA} = V_{GNDB}$, $T_A = +25^\circ C$, unless otherwise noted.) (Notes 1, 3)

($V_{DDA} - V_{GNDA} = 1.71V$ to $5.5V$, $V_{DDB} - V_{GNDB} = 1.71V$ to $5.5V$, $C_L = 15pF$, $T_A = -40^{\circ}C$ to $+125^{\circ}C$, unless otherwise noted. Typical values are at $V_{DDA} - V_{GNDA} = 3.3V$, $V_{DDB} - V_{GNDB} = 3.3V$, $V_{GNDA} = V_{GNDB}$, $T_A = +25^{\circ}C$, unless otherwise noted.) (Notes 2, 4)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
		$3.0V \leq V_{DD_} \leq 3.6V$			1.4	
		$2.25V \leq V_{DD_} \leq 2.75V$			1.9	
		$1.71V \leq V_{DD_} \leq 1.89V$			3	

Note 1: All devices are 100% production tested at $T_A = +25^{\circ}C$. Specifications over temperature are guaranteed by design and characterization.

Note 2: Not production tested. Guaranteed by design and characterization.

Note 3: All currents into the device are positive. All currents out of the device are negative. All voltages are referenced to their respective ground (GNDA or GNDB), unless otherwise noted.

Note 4: All measurements taken with $V_{DDA} = V_{DDB}$, unless otherwise noted.

Note 5: CMTI is the maximum sustainable common-mode voltage slew rate while maintaining the correct output. CMTI applies to both rising and falling common-mode voltage edges. Tested with the transient generator connected between GNDA and GNDB ($V_{CM} = 1000V$).

Test Circuit and Timing Diagram

Table 1. Insulation Characteristics

PARAMETER	SYMBOL	CONDITIONS	VALUE	UNITS
Partial Discharge Test Voltage	V _{PR}	Method B1 = V _{IORM} × 1.875 (t = 1s, partial discharge < 5pC)	3977	V _P
Maximum Repetitive Peak Isolation	V _{IORM}	(Note 6)	2121	V _P
Maximum Working Isolation Voltage	V _{IOWM}	Continuous RMS voltage (Note 6)	1500	V _{RMS}
Maximum Transient Isolation Voltage	V _{IOTM}	t = 1s (Note 6)	8000	V _P
Maximum Withstanding Isolation Voltage	V _{ISO}	f _{SW} = 60Hz, duration = 60s (Notes 6, 7)	5000	V _{RMS}
Maximum Surge Isolation Voltage	V _{IOSM}	Reinforced Insulation, test method per IEC 60065, V _{TEST} = 1.6 × V _{IOSM} = 10000V _{PEAK} (Note 9)	6250	V _P
Isolation Resistance	R _{IO}	V _{IO} = 500V, T _A = 25°C	> 10 ¹²	Ω
		V _{IO} = 500V, 100°C ≤ T _A ≤ 125°C	> 10 ¹¹	
		V _{IO} = 500V, T _S = 150°C	> 10 ⁹	
Barrier Capacitance Side A to Side B	C _{IO}	f _{SW} = 1MHz (Note 8)	1.5	pF
Minimum Creepage Distance	CPG		8	mm
Minimum Clearance Distance	CLR		8	mm
Internal Clearance		Distance through insulation	0.021	mm
Comparative Tracking Index	CTI	Material Group II (IEC 60112)	> 400	
Climate Category			40/125/21	
Pollution Degree (DIN VDE 0110, Table 1)			2	

Note 6: V_{ISO}, V_{IOTM}, V_{IOWM}, and V_{IORM} are defined by the IEC 60747-5-5 standard.

Note 7: Product is qualified at V_{ISO} for 60s and 100% production tested at 120% of V_{ISO} for 1s.

Note 8: Capacitance is measured with all pins on field-side and logic-side tied together.

Note 9: Devices are immersed in oil during surge characterization.

Safety Regulatory Approvals (Pending)**UL**

The MAX22245/MAX22246 are certified under UL1577. For more details, refer to File E351759.

Rated up to 5000V_{RMS} isolation voltage for single protection.

cUL (Equivalent to CSA notice 5A)

The MAX22245/MAX22246 are certified up to 5000V_{RMS} for single protection. For more details, refer to File E351759.

VDE

The MAX22245/MAX22246 are certified to DIN VDE V 0884-11: 2017-1. For details, see file reference TBD; Certificate Number TBD. Reinforced Insulation, Maximum Transient Isolation Voltage 8000V_{PK}, Maximum Repetitive Peak Isolation Voltage 2121V_{PK}.

This coupler is suitable for safe electrical insulation only within the safety ratings. Compliance with the safety ratings shall be ensured by means of suitable protective circuits.

Typical Operating Characteristics

($V_{DDA} - V_{GNDA} = +3.3V$, $V_{DDB} - V_{GNDB} = +3.3V$, $V_{GNDA} = V_{GNDB}$, $T_A = +25^\circ C$, unless otherwise noted.)

Pin Configurations**Pin Descriptions**

PIN		NAME	FUNCTION
MAX22245	MAX22246		
1	1	V _{DDA}	Power Supply Input for Side A. Bypass V _{DDA} to GNDA with a 0.1µF ceramic capacitor as close as possible to the pin.
2	—	IN1	Logic Input 1 on Side A
—	2	OUT1	Logic Output 1 on Side A
3	3	IN2	Logic Input 2 on Side A
4	4	GNDA	Ground Reference for Side A
5	5	GNDB	Ground Reference for Side B
6	6	OUT2	Logic Output 2 on Side B
7	—	OUT1	Logic Output 1 on Side B
—	7	IN1	Logic Input 1 on Side B
8	8	V _{DDB}	Power Supply Input for Side B. Bypass V _{DDB} to GNDB with a 0.1µF ceramic capacitor as close as possible to the pin.

Detailed Description

The MAX22245/MAX22246 are a family of 2-channel reinforced digital isolators. The MAX22245/MAX22246 have an isolation rating of 5kV_{RMS}. The MAX22245/MAX22246 family offers two unidirectional channel configurations to accommodate any 2-channel design.

The MAX22245 features two channels transferring digital signals in one direction for applications such as isolated digital I/O. The MAX22246 has one channel to transmit data in one direction and the other channel to transmit in the opposite direction, making it ideal for applications such as isolated RS232 or RS485 communication.

Devices are available in an 8-pin wide-body SOIC package with 8mm creepage and clearance and are rated up to 5kV_{RMS}. This family of digital isolators offers low-power operation, high electromagnetic interference (EMI) immunity, and stable temperature performance through Maxim's proprietary process technology. The devices isolate different ground domains and block high-voltage/high-current transients from sensitive or human interface circuitry.

Devices are available with a maximum data rate of either 25Mbps (B/E versions) or 200Mbps (C/F versions). The MAX2224_B/C feature default-high outputs. The MAX2224_E/F feature default-low outputs. The default is the state the output assumes when the input is not powered or if the input is open circuit. The devices have two supply inputs (V_{DDA} and V_{DDB}) that independently set the logic levels on either side of the device. V_{DDA} and V_{DDB} are referenced to GND_A and GND_B , respectively. The MAX22245/MAX22246 family also features a refresh circuit to ensure output accuracy when an input remains in the same state indefinitely.

Digital Isolation

The MAX22245/MAX22246 provide reinforced galvanic isolation for digital signals that are transmitted between two ground domains. The devices withstand differences of up to 5kV_{RMS} for up to 60 seconds, and up to 2121V_{PEAK} of continuous isolation.

Level Shifting

The wide supply voltage range of both V_{DDA} and V_{DDB} allows the MAX22245/MAX22246 to be used for level translation in addition to isolation. V_{DDA} and V_{DDB} can be independently set to any voltage from 1.71V to 5.5V. The supply voltage sets the logic level on the corresponding side of the isolator.

Unidirectional Channels

Each channel of the MAX22245/MAX22246 is unidirectional; it only passes data in one direction, as indicated in the functional diagram. Each device features two unidirectional channels that operate independently with guaranteed data rates from DC up to 25Mbps (B/E versions), or from DC to 200Mbps (C/F versions). The output driver of each channel is push-pull, eliminating the need for pullup resistors. The outputs are able to drive both TTL and CMOS logic inputs.

Startup and Undervoltage Lockout

The V_{DDA} and V_{DDB} supplies are both internally monitored for undervoltage conditions. Undervoltage events can occur during power-up, power-down, or during normal operation due to a sagging supply voltage. When an undervoltage condition is detected on either supply, all outputs go to their default states regardless of the state of the inputs as seen in [Table 2](#). [Figure 2](#) through [Figure 5](#) show the behavior of the outputs during power-up and power-down.

Table 2. Output Behavior During Undervoltage Condition

V_{IN}	V_{DDA}	V_{DDB}	V_{OUTA}	V_{OUTB}
1	Powered	Powered	High	High
0	Powered	Powered	Low	Low
X	Undervoltage	Powered	Default	Default
X	Powered	Undervoltage	Default	Default

Figure 5. Undervoltage Lockout Behavior MAX2224_E/F Input Low

Safety Limits

Damage to the IC can result in a low-resistance path to ground or to the supply and, without current limiting, the MAX22245/MAX22246 can dissipate excessive amounts of power. Excessive power dissipation can damage the die and

result in damage to the isolation barrier, potentially causing downstream issues. [Table 3](#) shows the safety limits for the MAX22245/MAX22246.

The maximum safety temperature (T_S) for the device is the 150°C maximum junction temperature specified in the [Absolute Maximum Ratings](#). The power dissipation (P_D) and junction-to-ambient thermal impedance (θ_{JA}) determine the junction temperature. Thermal impedance values (θ_{JA} and θ_{JC}) are available in the [Package Information](#) section and power dissipation calculations are discussed in the [Calculating Power Dissipation](#) section. Calculate the junction temperature (T_J) as:

$$T_J = T_A + (P_D \times \theta_{JA})$$

[Figure 6](#) and [Figure 7](#) show the thermal derating curve for safety limiting the power and the current of the device. Ensure that the junction temperature does not exceed 150°C.

Figure 6. Thermal Derating Curve for Safety Power Limiting

Figure 7. Thermal Derating Curve for Safety Current Limiting

Table 3. Safety Limiting Values for the MAX22245/MAX22246

PARAMETER	SYMBOL	TEST CONDITIONS	MAX	UNIT
Safety Current on Any Pin (No Damage to Isolation Barrier)	I _S	T _J = 150°C, T _A = 25°C	300	mA
Total Safety Power Dissipation	P _S	T _J = 150°C, T _A = 25°C	1418	mW
Maximum Safety Temperature	T _S		150	°C

Applications Information

Power-Supply Sequencing

The MAX22245/MAX22246 do not require special power-supply sequencing. The logic levels are set independently on either side by V_{DDA} and V_{DDB} . Each supply can be present over the entire specified range regardless of the level or presence of the other supply.

Power-Supply Decoupling

To reduce ripple and the chance of introducing data errors, bypass V_{DDA} and V_{DDB} with $0.1\mu F$ low-ESR ceramic capacitors to $GNDA$ and $GNDB$, respectively. Place the bypass capacitors as close to the power-supply input pins as possible.

Layout Considerations

The PCB designer should follow some critical recommendations in order to get the best performance from the design.

- Keep the input/output traces as short as possible. To keep signal paths low inductance, avoid using vias.
- Have a solid ground plane underneath the high-speed signal layer.
- Keep the area underneath the MAX22245/MAX22246 free from ground and signal planes. Any galvanic or metallic connection between the Side A and Side B defeats the isolation.

Calculating Power Dissipation

The required current for a given supply (V_{DDA} or V_{DDB}) can be estimated by summing the current required for each channel. The supply current for a channel depends on whether the channel is an input or an output, the channel's data rate, and the capacitive or resistive load if it is an output. The typical current for an input or output at any data rate can be estimated from the graphs in [Figure 8](#) and [Figure 9](#). Note that the data in [Figure 8](#) and [Figure 9](#) are extrapolated from the supply current measurements in a typical operating condition.

The total current for a single channel is the sum of the no load current (shown in [Figure 8](#) and [Figure 9](#)), which is a function of voltage and data rate, and the load current, which depends on the type of load. Current into a capacitive load is a function of the load capacitance, the switching frequency, and the supply voltage.

$$I_{CL} = C_L \times f_{SW} \times V_{DD}$$

where:

I_{CL} is the current required to drive the capacitive load.

C_L is the load capacitance on the isolator's output pin.

f_{SW} is the switching frequency (bits per second/2).

V_{DD} is the supply voltage on the output side of the isolator.

Current into a resistive load depends on the load resistance, the supply voltage and the average duty cycle of the data waveform. The DC load current can be conservatively estimated by assuming the output is always high.

$$I_{RL} = V_{DD} \div R_L$$

where:

I_{RL} is the current required to drive the resistive load.

V_{DD} is the supply voltage on the output side of the isolator.

R_L is the load resistance on the isolator's output pin.

Example (shown in [Figure 10](#)): A MAX22246 is operating with $V_{DDA} = 2.5V$, $V_{DDB} = 3.3V$, channel 1 operating at 100Mbps with a $15pF$ capacitive load, and channel 2 operating at 20Mbps with a $10k\Omega$ resistive load and 50% duty cycle. See [Table 4](#) and [Table 5](#) for V_{DDA} and V_{DDB} supply-current calculation worksheets.

V_{DDA} must supply:

- Channel 1 is an output channel operating at 2.5V and 100Mbps, consuming 0.84mA, estimated from [Figure 9](#).

- Channel 2 is an input channel operating at 2.5V and 20Mbps, consuming 0.35mA, estimated from [Figure 8](#).
- I_{CL} on Channel 1 for 15pF capacitor at 2.5V and 100Mbps is 1.875mA.

Total current for side A = $0.84\text{mA} + 0.35\text{mA} + 1.875\text{mA} = 3.065\text{mA}$ (typ)

V_{DDB} must supply:

- Channel 1 is an input channel operating at 3.3V and 100Mbps, consuming 1.16mA, estimated from [Figure 8](#).
- Channel 2 is an output channel operating at 3.3V and 20Mbps, consuming 0.41mA, estimated from [Figure 9](#).
- I_{RL} on Channel 2 for 10k Ω resistor held at 3.3V is 0.165mA.

Total current for side B = $1.16\text{mA} + 0.41\text{mA} + 0.165\text{mA} = 1.735\text{mA}$ (typ)

Figure 8. Supply Current per Input Channel (Estimated)
